Digital Nose Weight Gauge

Tow Ball Load Control (suitable for single axle caravans) -
Electronic Digital Nose Weight Gauge

Knowing the noseweight of your caravan is typically done with the help of a balance or a nose wheel gauge. The balance, having not been designed for this job, is inaccurate and too heavy to take along on a trip.

A plastic or metal nose wheel gauge functions with a steel spring, because of this it is also very inaccurate and being under constant load presents a danger if the housing fractures allowing the spring to "explode".

The towbar load control combines a fine design with utmost accuracy and avoids problems associated with a wheel nose gauge.

Digital read out in steps of 1 kilo (up to a maximum of 105kg) and, of course, no spring.

Requires 2 x AAA-batteries (not supplied).

Simple to use and ensures safety before you tow.
